## BUILDING WITH TEIFOE

To make the cement: mix 3 level tablespoons of cement powder with 1 table spoon of water until the mixture is smooth. It is best to mix the cement so it is somewhat dry (it should not be runny!).

Take a brick and apply sufficient cement. Place the brick straight and level on the floor or structure and push down firmly. Remove the excess cement with the trowel. This way you will get good joints and straight walls. The wooden and plastic parts can also be attached with the cement.

You can demolish your house by soaking it for 4 to 5 hours in water. Rinse the bricks clean and let them dry.

You can build according to our plans or your imagination. Your creations will constantly improve! Lots of pleasure with TEIFOE!

3 cement + 1 water
